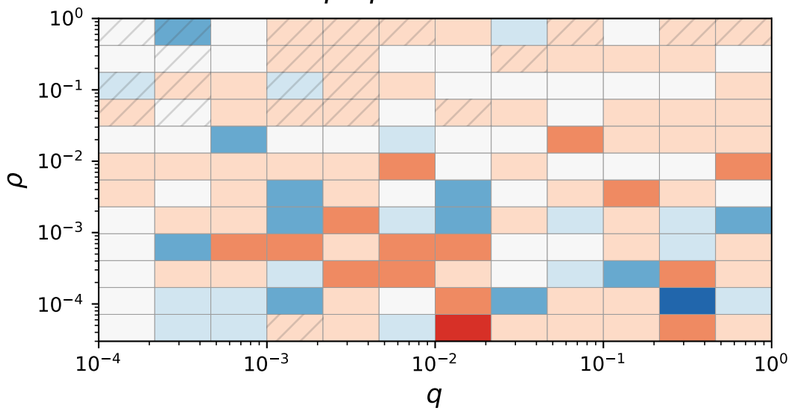
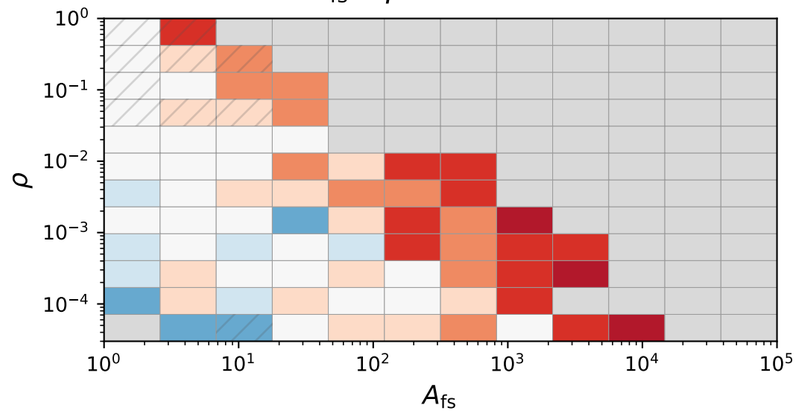
LD on (linear, c=0.5), VBM speed target $\varepsilon_{rel} = 10^{-3}$

current V2 adaptive: flux_adaptive_integrate body only; topology prebuilt; value-converged 3451/3608 (95.6%), map keeps finite positive V2 outputs; hatched cells contain at least one non-converged value

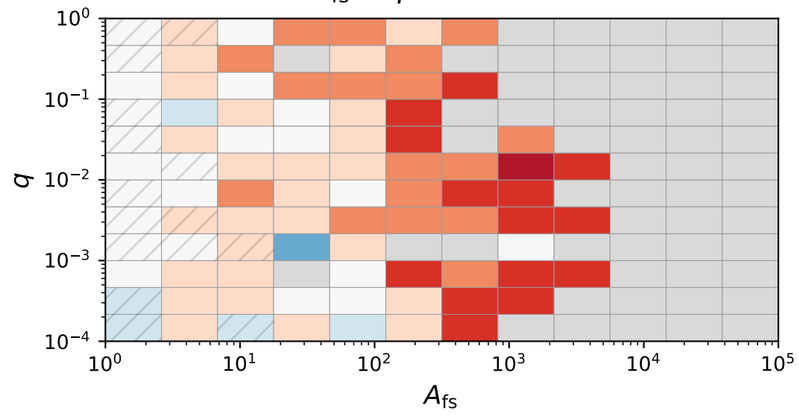
$q \times \rho$ — runtime

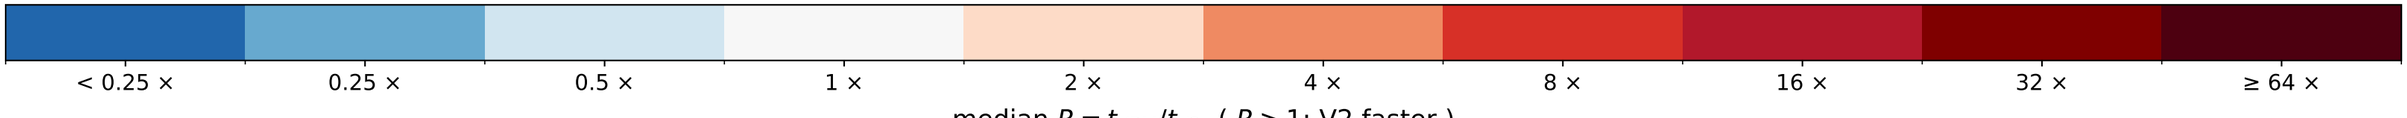


$A_{fs} \times \rho$ — runtime



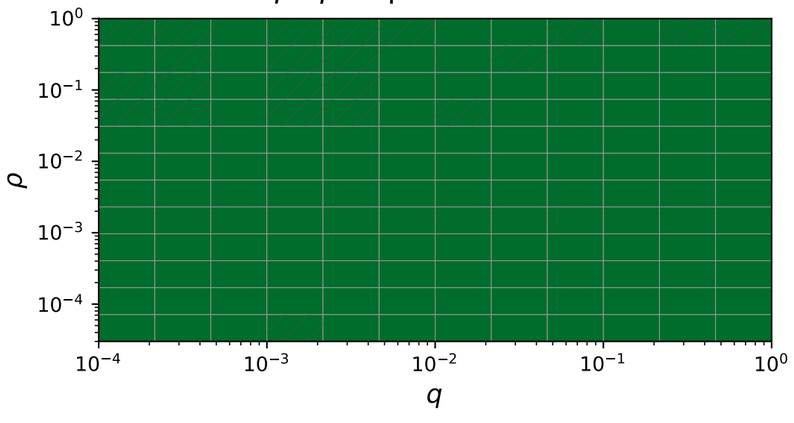
$A_{fs} \times q$ — runtime



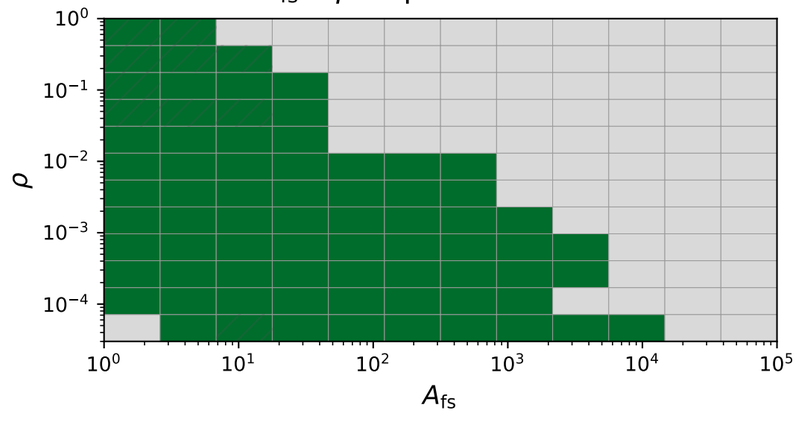


median $R = t_{VBM}/t_{V2}$ ($R > 1$: V2 faster)

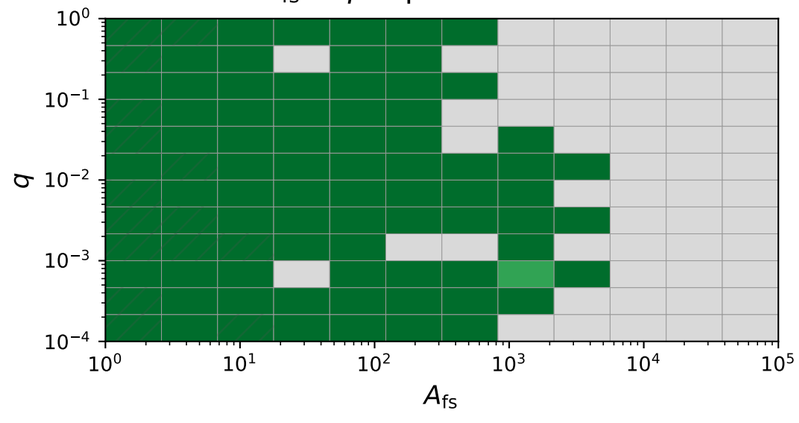
$q \times \rho$ — p95 difference

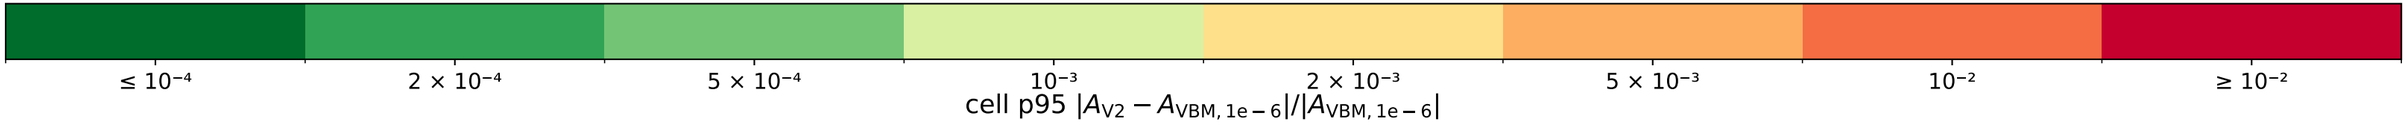


$A_{fs} \times \rho$ — p95 difference



$A_{fs} \times q$ — p95 difference





Grey cells: fewer than 8 converged mapped points. Error uses value-converged V2 values against the existing VBM RelTol=1e-6 reference; hatching marks incomplete value coverage.
