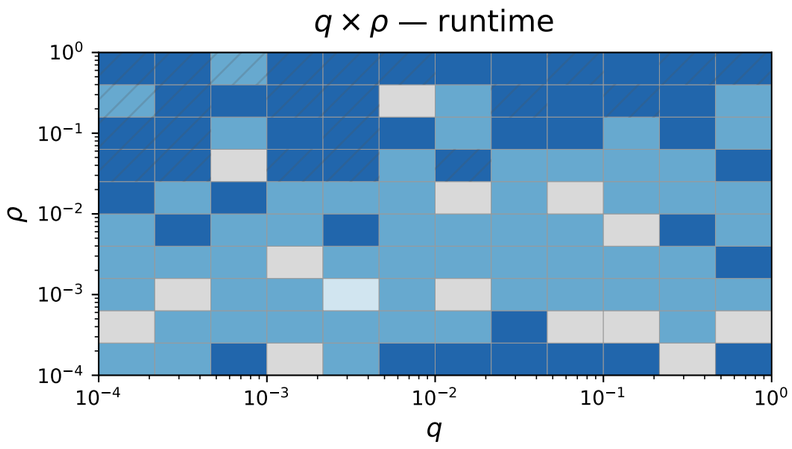
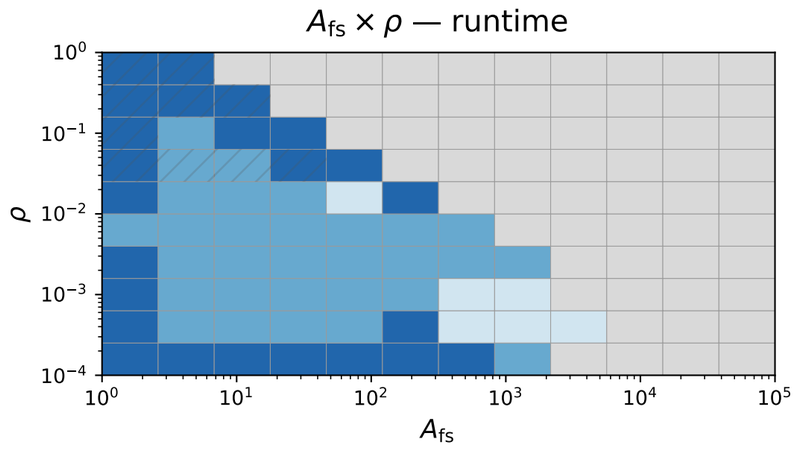
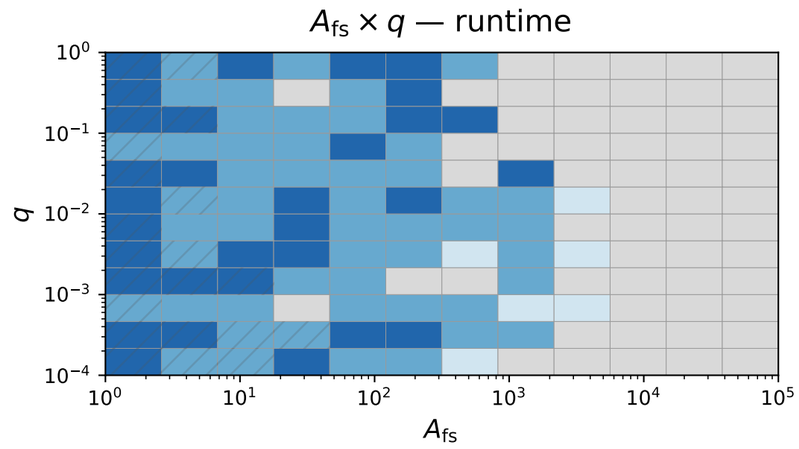
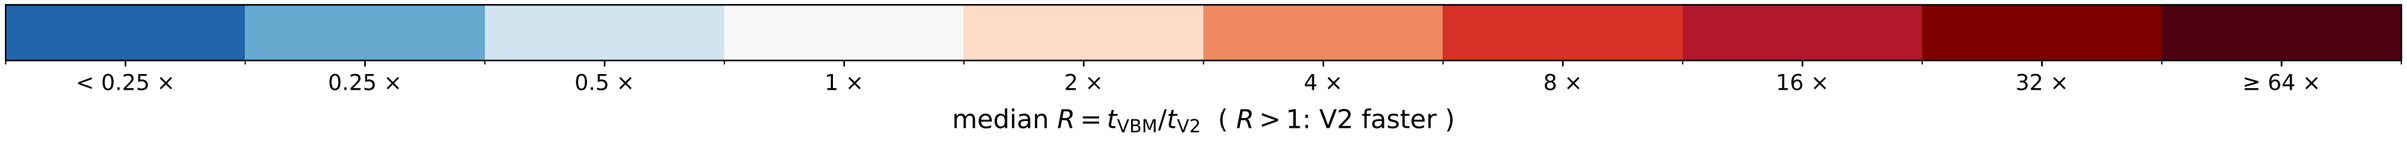
LD off (uniform), VBM speed target $\varepsilon_{rel} = 10^{-3}$

current V2: n_r=64, flux_value_integrate body only; pf/topology prebuilt; V2 status OK 3366/3608 (93.3%), map keeps finite positive V2 outputs; hatched cells contain at least one non-OK V2 point

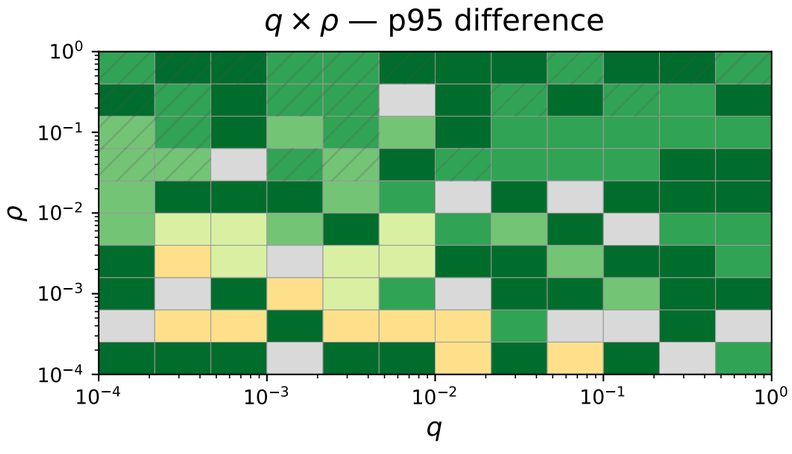


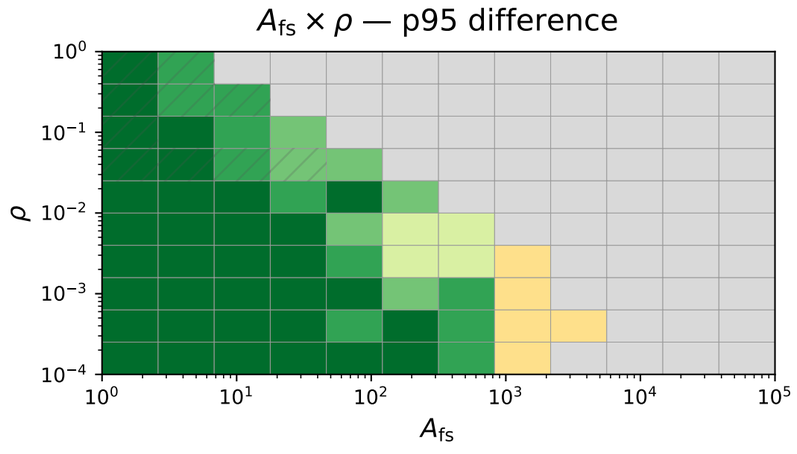


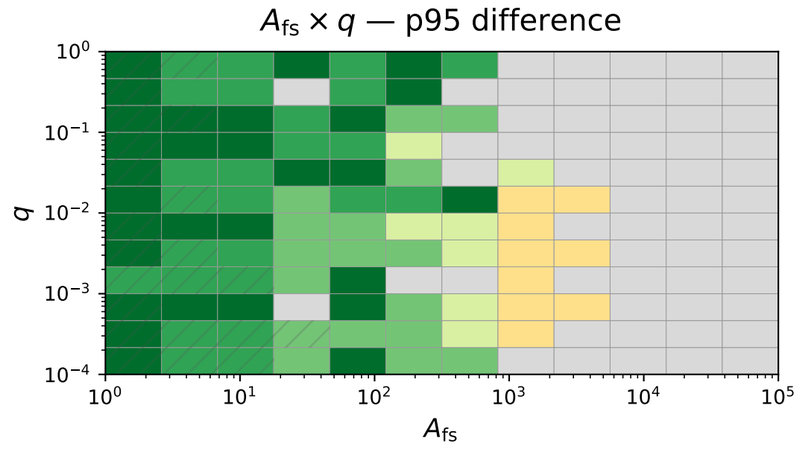


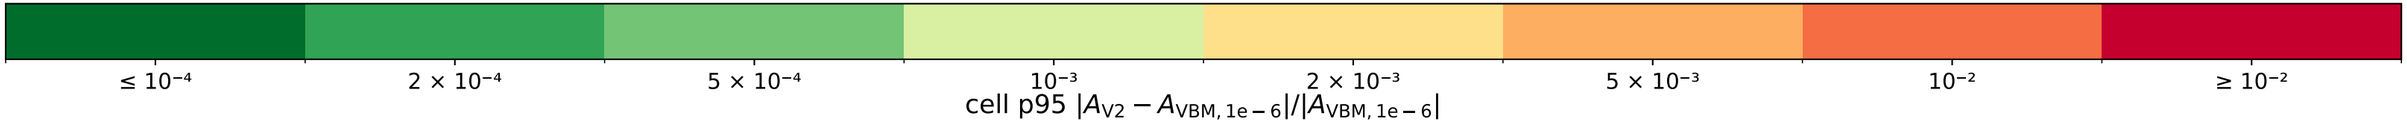


median $R = t_{VBM}/t_{V2}$ ($R > 1$: V2 faster)









Grey cells: fewer than 8 mapped points. Error uses all finite V2 values against the existing VBM RelTol=1e-6 reference.
